

## WET TRIM BLADE

### SaberTooth

The Sabertooth features long thin wide spaced teeth and a tapered end allowing for precision manicuring. This blade is unique in that the teeth at the end slant forward for direct spot-on trimming. This design permits the plant to be trimmed in a manner very similar to manual scissors by only removing the intended material while leaving the surrounding areas untouched.

## WET TRIM BLADE

### Butterfly

A hybrid of the Sabertooth and Hammerhead, the Butterfly is dual sided for volume trimming and thinning out overgrowth. Forward angled teeth at the tip provide for spot-on lightning fast precision manicuring.
